

OneInbox Tools Guide v1.0

OneInbox Tools Guide (Version 1.0)

Give your agent the ability to take action during a call.

What are Tools?

Tools are actions your agent can perform mid-call. They fire automatically based on conversation context. The agent's LLM reads the tool description to decide when to trigger each tool.

OneInbox supports 6 tool types:

1. `api_call` - Call your own HTTP endpoint during the call
2. `transfer_call` - Transfer the caller to a real phone number
3. `end_call` - Hang up the call cleanly
4. `send_sms` - Send a text message
5. `send_email` - Send an email
6. `extract_information` - Silently capture structured data from the conversation

Creating a Tool

POST `/v1/tools` with a JSON body specifying name, type, and description.

The description field is the trigger signal. The LLM reads it to decide when to fire the tool automatically. Write it as a trigger condition, not a label.

Example: `send_sms` tool

```
{
  "name": "notify_team_sms",
  "type": "send_sms",
  "description": "SMS the team when a lead is captured.",
  "messaging_config": {
    "to": "caller",
    "body_template": "New lead: {name} ({phone})"
  }
}
```

Attaching Tools to an Agent

Creating a tool makes it available in your account, but the agent cannot use it yet. You must attach it to the LLM model linked to your agent:

PATCH `/v1/models/<llm_id>`

```
{"tool_ids": ["<tool_id_1>", "<tool_id_2>"]}
```

Every agent linked to this `llm_id` picks up the change immediately.

Transfer Call Modes

OneInbox supports two transfer modes:

- Cold (default): Blind SIP REFER, caller is immediately handed off
- Warm: Agent calls the human first, briefs them, then connects the caller

Reading Tool Results After a Call

After the call ends, extracted data and tool activity appear in the call record. Fetch with GET /v1/calls/<call_id>.
